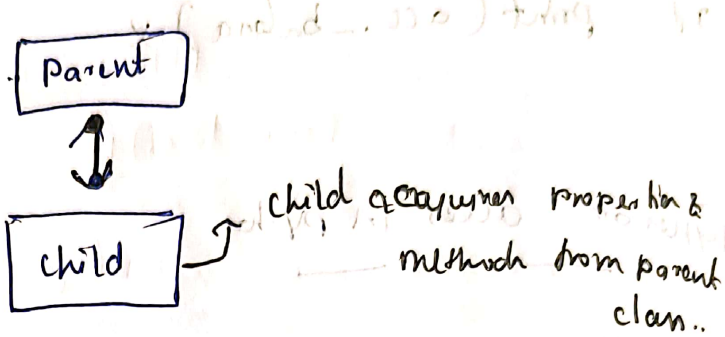
Topic - 8 :-

"Inheritance in python"

Inheritance is a mechanism where one class (child class) acquires the properties and methods of another class (parent class)

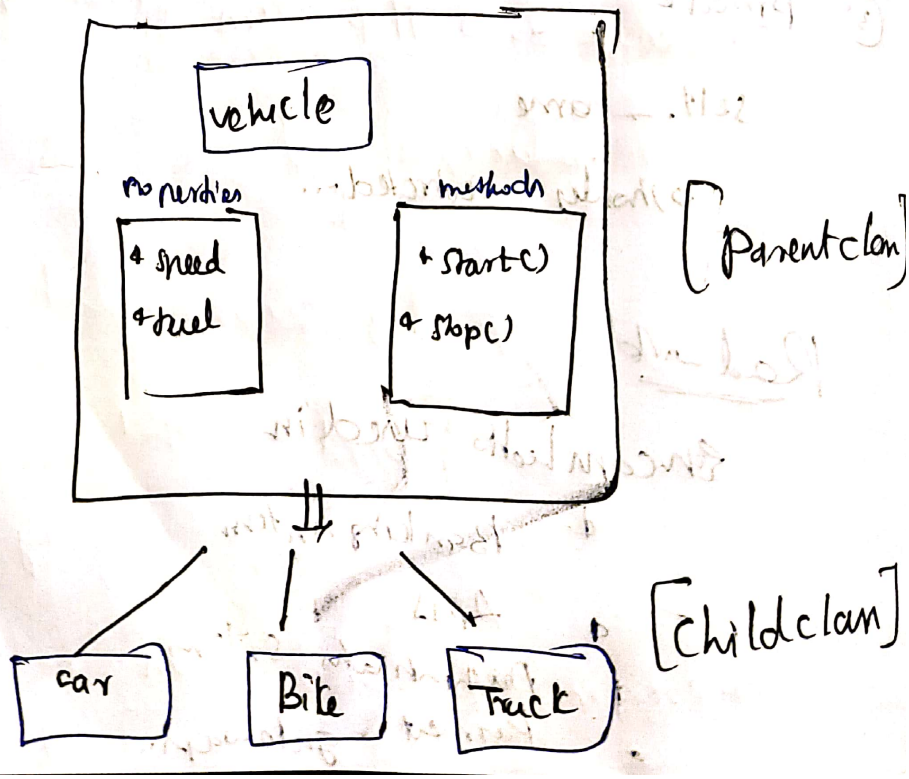


Inheritance = reuses existing code + extend functionality..

Instead of writing the same code again, we reuse a class and build new features on top of it..

Realworld - Example

Think



Scanned with OKEN Scanner

Syntax.

```
class parent:
    # parent properties & methods.
class child(parent):
    # child properties & methods.
```

Example

```
def parent:
    def parent_method(self):
        print("Hello I am parent class")

def child(parent):
    def child_method(self):
        print("Hello I am from child class")
```

```
c = child()
c.parent_method
c.child_method
```

[child class object is calling parent class method]

↓

which inheritance is hierarchical

☆ This code reuse

Contructor in inheritance:

```
class Animal:
    def __init__(self, name):
        self.name = name

class Dog(Animal):
    def show(self):
        print(self.name)

d = Dog("Bandy")
d.show()
# Bandy.
```
